

Thank you for purchasing the patented Vortex Javelin Precision Applicator™

This attachment will allow the operator to apply material in confined areas and containers with precision.

The small flat head screws near the end of the Javelin PA™ are designed to diffuse more or less material by moving these screws in and out. If a backup of material occurs, moving the screws outward will take care of this issue. The larger hex head screws remain in the inward position and the diffuser is adjusted using the flat head screws.

Wash the Javelin PA™ with water to clean the diffuser and screening after each use. As always if you have any questions or comments please call 877-8VORTEX or 954-650-7590.

Once again thank you for purchasing a Vortex Granular Systems product!
